PsychoPy

Start

Do you have python installed on your laptop??

Do you have Windows or Mac?

Are you expert in Python?
(Do you know what a python environment is? Do you know how to create one with specific python version??)

Uninstall python
We recommend installing Python following our guidelines. This ensures compatibility with our tutorials and helps us provide better support. Multiple Python versions can cause conflicts.

Did you install python using miniconda??

As you are already an expert, we will leave it to you to install the required packages.
What we suggest you to have for the following the tutorials on the website is 2 environments:

1. Should have at least pandas, numpy, matplotlib, seaborn, and I2MC installed
2. Should have PsychoPy installed (you can also install PsychoPy as standalone software)

Install python and libraries

Our favourite way to install python is by using miniconda. → **Click here for instructions**

You will need to create a virtual environment → **Click here for instructions**

You will require some libraires to process the data → **Click here for instructions**

You will need an IDE, we recommend Spyder → **Click here for instructions**

You will need Psychopy to create a small study → **Click here for instructions**

Psychopy standalone
Sometimes it may be complex to install PsychoPy as a library. In case you encounter any error, you can install PsychoPy as a standalone software.

Final checks
To double check you Psychopy installation we will ask you to test it by running a small script

Had problems installing Pyschopy?

Click here for instructions

Run the check

Did everything go well?
(did you see the message that you are ready for the workshop?)

That's unfortunate!
- Please let us know what issues you're experiencing - we're happy to help troubleshoot.
- Also, the PsychoPy forum is an excellent resource with many experts

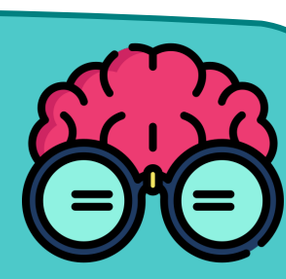
Check the Psychopy forum

Well done!!!


You are officially one of us nerds now!!!!
